

Spenny Piggy – Audit Logs & Stripe Compliance (Developer Spec)

Objective

Provide a full audit trail system that demonstrates to Stripe that Spenny Piggy actively monitors, reviews, and enforces platform rules, linking content moderation directly to payment activity.

Core Principle

Every moderation action must be traceable, explainable, and linked to a specific piece of content and, where applicable, a payment event.

1. Content Details (What happened)

- Content type (wish, bill, post, message, membership) - Creator ID and name - Supporter/Gifter ID (if applicable) - Content ID / URL - Date created - Date action taken - Current status (removed, hidden, suspended, etc.)

2. Reason for Action (Why it happened)

- Rule violated (off-platform payments, prohibited content, harassment, fraud risk, etc.) - Risk level (low, medium, high, critical) - Trigger source (AI, keyword, user report, admin review, Stripe signal)

3. Evidence (Proof)

- Full original content snapshot - Screenshots/previews - Flagged keywords or AI signals - Linked Stripe payment IDs (PaymentIntent, Charge, Application Fee) - Related messages or reports

4. Action Taken (Platform response)

- Action type (removed, suspended, warned, payout delayed, etc.) - Admin reviewer - Decision timestamp - Internal notes - Creator notification status and message sent

5. Payment Impact (Critical for Stripe)

- Was payment completed or blocked? - Was payout delayed or held? - Was refund issued? - Was creator account restricted? - Escalation status

6. System Requirements

- Store all audit logs permanently - Link moderation logs to transactions - Allow filtering by creator, risk level, and date - Provide search functionality - Enable export to CSV/PDF

7. Stripe Expectations

Stripe expects platforms to demonstrate: - Active monitoring of user content - Enforcement of platform rules - Ability to trace risk to payments - Clear audit logs for disputes and compliance reviews
