

Spenny Piggy

Creator Financial Dashboard, Supporter-Paid Fees, Friday Payouts, and Stripe Webhook Mapping

Purpose

This document defines the final creator-facing financial logic for Spenny Piggy, the internal transaction logic required to support it, the weekly Friday payout flow, the Stripe webhook mapping, and the exact wording the product team should use across the UI. The goal is to keep the creator experience simple and high-trust while preserving full Merchant of Record accounting internally.

Locked product rule: creators only see money that belongs to them. Supporter-paid platform fees and supporter-paid processing fees must be tracked internally but hidden from the creator dashboard.

Area	Final rule
Creator gross	Show only the amount the creator listed or earned, for example GBP 100. Do not inflate this by adding platform fee or Stripe fee.
Creator net	Net = Gross - Expenses. Do not subtract platform fee. Do not subtract Stripe fee, because the supporter covers it.
Fees in creator UI	Do not show platform fee, Stripe fee, total supporter charge, or VAT in the creator dashboard.
Internal accounting	Store the full charge amount, creator amount, platform fee, Stripe fee, tax, refund status, and payout status for every transaction.
Payouts	Creators are paid every Friday. Dashboard copy must state this clearly.

1. Transaction model

Example transaction: the creator sets a price of GBP 100. The supporter pays the creator amount plus a platform fee and the processing fee. For example, the supporter may pay about GBP 119.90 in total. The creator still sees and receives GBP 100 before any self-added expenses.

Component	Who pays it	Visible to creator
Creator amount	Supporter	Yes
Platform fee, for example about 17 percent	Supporter	No
Stripe or payment processing fee, for example about 2.9 percent	Supporter	No
VAT or sales tax if applicable	Supporter	No

Creator-facing formulas

Gross Earnings = total earned by the creator from supporters.

Net Earnings = Gross Earnings - Expenses.

Processing fees are not part of the creator formula because the supporter covers them. Platform fees are not part of the creator formula because they are platform revenue, not creator earnings.

2. Creator dashboard requirements

Required top-level metrics

- Gross Earnings: the creator's earned amount only.
- Expenses: manually logged by the creator.
- Net Earnings: Gross Earnings - Expenses.
- Next payout: the upcoming Friday payout date and status.

Do not show the following in the creator dashboard

- Platform fee
- Stripe fee or processing fee
- Total supporter charge
- VAT or tax collected from the supporter

UI element	Approved wording
Gross card	Gross Earnings
Gross helper text	Total sent to you by supporters.
Expenses card	Expenses
Expenses helper text	Optional costs you track for your own records.
Net card	Net Earnings
Net helper text	What you keep after expenses.
Trust line	You keep 100% of what you earn. Supporters cover all fees.
Payout line	Payouts are sent every Friday.

3. Friday payout flow

Payout cadence

Creators are paid every Friday. The system should roll up eligible cleared earnings into the Friday payout batch. The creator dashboard should show the next payout date, the current payout status, and a payout history.

Recommended payout states

Status	Meaning
Pending	Charge is successful but not yet included in a Friday payout.
Scheduled	Charge has been allocated to the next Friday payout batch.
In transit	Stripe payout has been created and is on the way.
Paid	Funds arrived successfully.
Failed	Payout failed and needs attention or updated bank details.
Held	Temporarily held for review, reserve, or risk action.

Recommended creator payout UI copy

Next payout: Friday 21 March

Your available balance will be included in Friday payouts once cleared.

Payouts are sent every Friday. Bank arrival times may vary.

4. Internal data model

Transaction

- id
- creator_id
- supporter_id
- currency
- total_charge_amount
- creator_amount
- platform_fee_amount
- processing_fee_amount
- tax_amount
- charge_status
- refund_status
- payout_status
- stripe_payment_intent_id
- stripe_charge_id
- stripe_transfer_id or equivalent ledger reference
- available_on_date
- created_at

Creator ledger entry

- id
- creator_id
- transaction_id
- gross_amount
- expense_amount
- net_amount
- payout_batch_id nullable
- payout_status
- created_at

Payout batch

- id
- payout_date
- currency
- total_creator_amount
- total_entries
- stripe_payout_id
- status
- created_at

5. Stripe webhook mapping

The platform should maintain an internal ledger driven by Stripe webhooks. The creator UI must never depend on a single synchronous client response for its source of truth.

Stripe event	Developer action
checkout.session.completed or payment_intent.succeeded	Create or confirm transaction record. Calculate creator_amount, platform_fee_amount, processing_fee_amount, and total_charge_amount. Mark creator funds as pending.
charge.succeeded	Attach final Stripe charge identifier. Confirm successful collection for reconciliation.
balance.available	Update available_on_date or internal availability if the funds are now clear for payout scheduling.

payout.created	Create or update payout batch record. Mark included creator ledger entries as In transit.
payout.paid	Mark payout batch and included creator ledger entries as Paid.
payout.failed	Mark payout batch and included creator ledger entries as Failed. Surface an action prompt for the creator to update payout details.
charge.refunded or refund.updated	Reverse or adjust creator ledger according to refund policy. If already paid out, create a negative adjustment or reserve according to internal rules.
charge.dispute.created	Flag transaction for review. Optionally hold affected funds or future payout amounts depending on risk policy.
account.updated for connected account	Refresh payout eligibility, requirements due, and bank account status for creator onboarding and payouts.

Webhook implementation notes

- Verify webhook signatures and store raw event ids to prevent duplicate processing.
- Webhook handling must be idempotent. Replays must not duplicate ledger entries or payout entries.
- Use the internal database as the source of truth for UI summaries, payout history, and exports.
- Every ledger update should be auditable with timestamps and the originating Stripe object id.

6. Site-wide product wording

Approved user-facing copy

Surface	Copy
Creator dashboard banner	You keep 100% of what you earn. Supporters cover all fees.
Payout section	Payouts are sent every Friday.
Payout helper text	Your cleared earnings will be included in the next Friday payout.
Creator onboarding payments explainer	Supporters cover platform and payment fees, so you receive your full listed amount.
Expense section	Track optional expenses for your own records. Net Earnings = Gross Earnings - Expenses.
Transaction list item	Earned
Transaction detail helper text	This is the amount added to your earnings.

7. Acceptance criteria

- A creator who lists GBP 100 sees Gross Earnings of GBP 100.
- Net Earnings is calculated as Gross Earnings minus creator-added expenses only.
- No creator-facing screen exposes platform fee, processing fee, tax, or total supporter charge.
- The dashboard clearly states that payouts are sent every Friday.
- The dashboard shows next payout date, payout status, and payout history.
- Webhook processing is idempotent and updates the internal ledger correctly.

- Refunds, disputes, and payout failures update creator balances and statuses according to internal rules.
- Admin tools and exports still retain full Merchant of Record accounting for every transaction.

Final product decision

Creator dashboard: Gross Earnings, Expenses, Net Earnings, and Friday payout status only.
Internal system: full charge accounting and webhook-driven reconciliation. This is the final implementation direction for the financial dashboard and payout experience.
